

Introduce yourselves, and discuss how you are going to carry out the group (lab) exercises:

- **What are your skills and strengths? The mini-projects will require a combination of skills: knowledge of open source software projects, usage of many tools (for revision control, building software, testing, quality assurance), understanding requirements, documentation, mining bug/issue trackers, knowledge of theory, etc.**

Everyone has worked with Github, Docker. We all are from computer science major and most of us have industry experience beforehand.

- **How do you want to communicate? In person, by e-mail, chat, slack?**

We are planning to communicate on Slack.

- **How will you keep track of open tasks?**

All tasks will be kept on on Github.

- **How do you plan to work? You can use two lab computers with pair (or triple) programming, your own environment, etc. Note that two thirds (2/3) of the work will be carried out outside supervised and planned lab sessions!**

A combination of pair programming and individual programming.

- **How will you write the documentation? (Any tool that produces a PDF in the end is fine with us.)**

Markdown then convert it to pdf.

- **Is there anyone who cannot be present in lab sessions? How do you compensate for this? (This is particularly important for the final session in each mini-project).**

- **Agree on a code of conduct relating to the items stated above, in particular to possible absences in the lab session.**

Inform the group one day ahead if you cannot be present at a group meeting.
